USER INTERFACE AND DESIGN

EXPERIMENT 5

Name: Sivaguru D **Roll No:** 240701517

Task Analysis Task Analysis is the process of breaking down a user's interactions with a system into smaller, manageable steps to understand how users achieve their goals. It helps in identifying user needs, pain points, and areas for improvement.

Key Aspects of Task Analysis:

- Understanding what tasks users perform.
- Identifying the sequence of actions required to complete a task.
- Analyzing user pain points and inefficiencies.
- Defining requirements to improve the user experience.

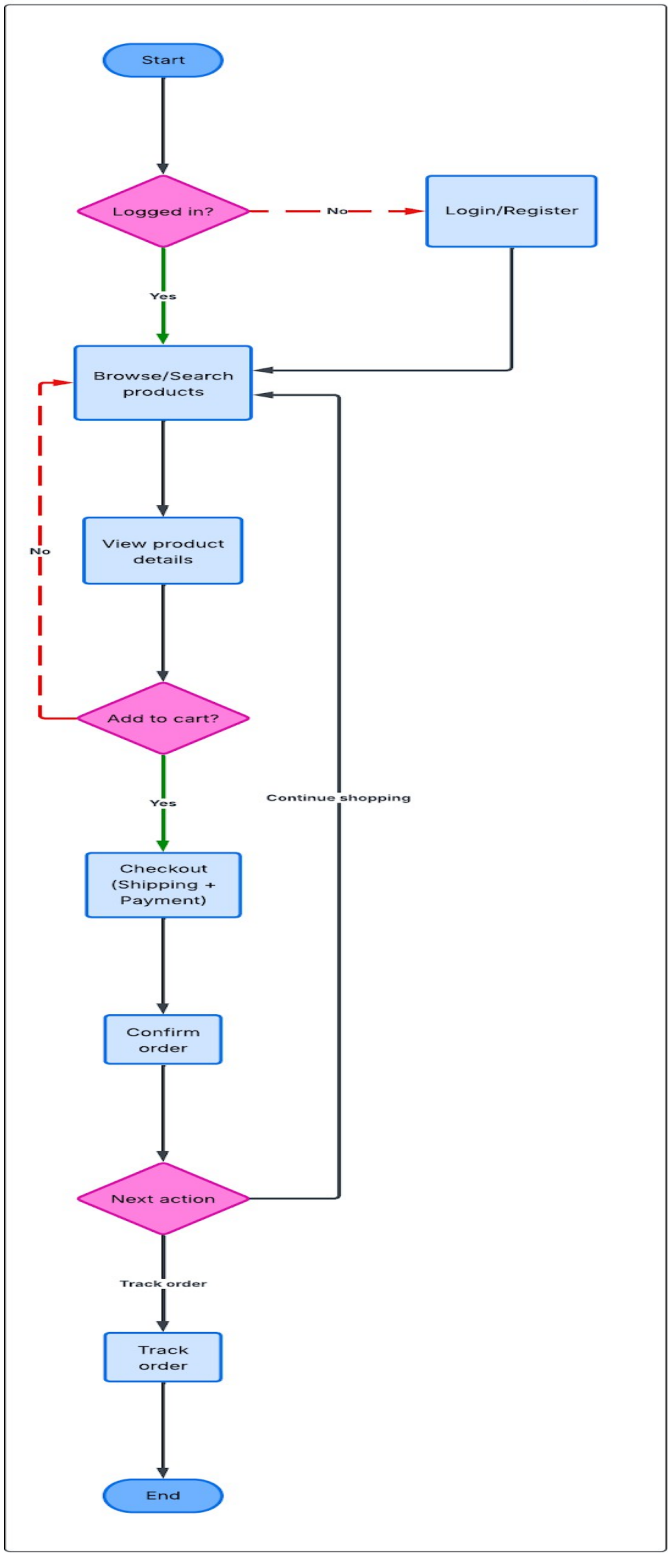
User Flow User Flow is a visual representation of how users navigate through an application to complete a specific goal. It shows the steps users take from the entry point to the final action.

Key Aspects of User Flow:

- Represents decision-making paths (e.g., what happens if a user decides not to add an item to the cart?).
- Maps different navigation possibilities (e.g., alternative ways to reach the goal, looping back to shop more).
- Shows how users move between screens.

User Flow for an E-Commerce Website (Based on Diagram) Start → Logged In? → Login/Register (if No) → Browse/Search products → View product details → Add to cart? → Checkout (Shipping + Payment) → Confirm order → Next action → Track order → End

E-commerce Purchase Flowchart



Step-by-Step Breakdown for the E-Commerce User Flow

Step 1: Start

- The user initiates the application or website experience.

Step 2: Check Login Status

- The system evaluates if the user is currently "Logged In?".
- If **Yes**, the user is routed directly to the product catalog.
- If **No**, the user is directed to a "Login/Register" screen to authenticate or create an account before they can continue.

Step 3: Browse/Search Products

- The user lands on the main catalog where they can browse categories or search for specific items.

Step 4: View Product Details

- The user selects a specific item from the catalog to view its detailed information, specifications, and images.

Step 5: Add to Cart Decision

- The user must make a decision: "Add to cart?".
- If **No**, the flow loops them backward to "Browse/Search products" so they can look at other items.
- If **Yes**, the item is added, and the user moves forward in the purchasing journey.

Step 6: Checkout (Shipping + Payment)

- The user enters the checkout phase, where they input both their shipping details and their payment information to finalize the purchase.

Step 7: Confirm Order

- The system processes the checkout details and displays an order confirmation screen to the user.

Step 8: Determine Next Action

- After confirming the order, the user faces a decision point for their "Next action".
- If the user chooses **Continue shopping**, they are looped all the way back up to the "Browse/Search products" stage.
- If the user chooses **Track order**, they proceed down the tracking path.

Step 9: Track Order

- The user views the tracking details to see the current status and estimated delivery of their newly placed order.

Step 10: End

- The primary user flow for this session concludes.
